No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   invention are useful for treating disorders associated with increase in cell death or apoptosis such as acquired immunodeficiency syndrome (AIDS), neurodegenerative diseases (e.g., Alzheimer's disease, retinitis pigmentosa, Parkinson's disease and cerebellar degeneration), ischaemic injuries (e.g., myocardial infarction, stroke, reperfusion injury), myelodysplastic syndromes (e.g., aplastic anaemia), toxin-induced diseases and other infectious or genetic immunodeficiencies. Sequences of the invention are used as vaccines and in gene therapy. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      proteins and polynucleotides encoding such proteins. Sequences of the invention are useful to screen potential cellular apoptosis inhibiting compounds to determine their use as therapeutic agents for treatment of diseases associated with increased programmed cell death. They are also useful for treating or preventing disorders associated with decrease in apoptosis. Programmed cell death modulating sequences are useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel programmed cell death modulating proteins, useful for treating preventing disorders associated with abnormal cell proliferation and apoptosis such as cancer, stroke, Parkinson's disease, myocardial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Drosophila melanogaster polypeptide SEQ ID NO 40227.

Sequences of the cinvention are useful to screen potential cellular apoptosis inhibiting cc compounds to determine their use as therapeutic agents for treatment of compounds to determine their use as therapeutic agents for treatment of compounds to determine their use as therapeutic agents for treatment of cuseful for treating or preventing disorders associated with decrease in apoptosis. Programmed cell death modulating sequences are useful for treating or preventing cancer e.g. adenocarcinoma, leukaemia, lymphoma, company anyeloma. Inhibition of the activity of the sequences of the cinvention are useful for treating disorders associated with increase in cell death or apoptosis such as acquired immunodeficiency syndrome (AIDS), neurodegenerative diseases (e.g., Alzheimer's disease, retinitis congenerations, parkinson's disease and cerebellar degeneration), ischaemic injuries (e.g., myocardial infarction, stroke, reperfusion injury), confidences and other infectious or genetic immunodeficiencies. Sequences of the invention are used as vaccines and in gene therapy. The present

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CC proteins and polynucleotides encoding such proteins. Sequences of the CC invention are useful to screen potential cellular apoptosis inhibiting CC compounds to determine their use as therapeutic agents for treatment of diseases associated with increased programmed cell death. They are also CC useful for treating or preventing disorders associated with decrease in CC apoptosis. Programmed cell death modulating sequences are useful for treating or preventing cancer e.g. adenocarcinoma, leukaemia, lymphoma, CC melanoma, myeloma. Inhibition of the activity of the sequences of the CC invention are useful for treating disorders associated with increase CC invention are useful for treating disorders associated with increase CC invention are useful for treating disorders associated with increase CC injuries, neurodegenerative diseases (e.g., Alzheimer's disease, retinitis CC pigmentosa, Parkinson's disease and cerebellar degeneration), ischaemic CC injuries (e.g., myocardial infarction, stroke, reperfusion injury), CC myelodysplastic syndromes (e.g., alzheimer's disease, retinitis continuous of the invention are used as vaccines and in gene therapy. The present CC sequence is nematode E93 programmed cell death modulating protein CC conserved domain.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            treating or preventing cancer e.g. adenocarcinoma, leukaemia, lymphoma, melanoma, myeloma. Inhibition of the activity of the sequences of the invention are useful for treating disorders associated with increase in cell death or apoptosis such as acquired immunodeficiency syndrome (AIDS), neurodegenerative diseases (e.g., Alzheimer's disease, retinitis plymentosa, Parkinson's disease and cerebellar degeneration), ischaemic injuries (e.g., myocardial infarction, stroke, reperfusion injury), myelodysplastic syndromes (e.g., aplastic anaemia), toxin-induced diseases and other infectious or genetic immunodeficiencies. Sequences of the invention are used as vaccines and in gene therapy. The present sequence is human E93 programmed cell death modulating protein conserved
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to novel programmed cell death modulating proteins and polynucleotides encoding such proteins. Sequences of the invention are useful to screen potential cellular apoptosis inhibiting compounds to determine their use as therapeutic agents for treatment of diseases associated with increased programmed cell death. They are also useful for treating or preventing disorders associated with decrease in apoptosis. Programmed cell death modulating sequences are useful for treating or preventing cancer e.g. adenocarcinoma, leukaemia, lymphoma,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; cancer; programmed cell death modulating protein; adenocarcinoma; cellular apoptosis; leukaemia; acquired immunodeficiency syndrome; AIDS; neurodegenerative disease; Alzheimer's disease; retinitis pigmentosa; Parkinson's disease; myelodysplastic syndrome; cerebellar degeneration;

Inhibition of the activity of the sequences of the invention are useful for treating disorders associated with increase in cell death or apoptosis such as acquired immunodeficiency syndrome (AIDS), neurodegenerative diseases (e.g., Aliheimer's disease, retinitis pigmentosa, Parkinson's disease and cerebellar degeneration), ischaemic injuries (e.g., myocardial infarction, stroke, reperfusion injury), myelodysplastic syndromes (e.g., aplastic anaemia), toxin-induced disease and other infectious or genetic immunodeficiencies. Sequences of the invention are used as vaccines and in gene therapy. The present sequence is human E93 programmed cell death modulating protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              proteins and polynucleotides encoding such proteins. Sequences of the invention are useful to screen potential cellular approosis inhibiting compounds to determine their use as therapeutic agents for treatment of diseases associated with increased programmed cell death. They are also useful for treating or preventing disorders associated with decrease in apoptosis. Programmed cell death modulating sequences are useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 preventing disorders associated with abnormal cell proliferation and apoptosis such as cancer, stroke, Parkinson's disease, myocardial infarction -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 1; Fig 4;
                                                                                    New isolated polynuclectide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutation responsible for genetic disorders or other traits and to assess
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel human diagnostic protein #17933
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ABG17942 standard; Protein; 630 AA

The invention relates to isolated polynucleotide (I) and CC polypeptide (II) sequences. (I) is useful as hybridisation probes, CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The CC polynucleotides are also used in diagnostics as expressed sequence tags CC for identifying expressed genes. (I) is useful in gene therapy techniques CC for testore normal activity of (II) or to treat disease states involving CC quantitating a polypeptide in tissue, as molecular weight markers and as CC a food supplement. (II) and its binding partners are useful in medical CC diagning of sites expressing (II). (I) and (II) are useful for treating CC diagnostics, forensics, gene mapping, identification of mutations CC responsible for genetic disorders or other traits to assess biodiversity CC and to produce other types of data and products dependent on DNA and CC diagnostic amino acid sequences. ABG00010-ABG30377 represent novel human CC CC anino acid sequences. ABG00010-ABG30377 represent novel human can be printed.

Claim 10; Page 971-972; 2508pp; English

CC polyppides, methods of screening for modulators of ORFX expression or a ctivity, and methods of screening individuals for a prediagosition to an ORFX-associated disorder. The ORFX proteins of the invention have a wide CC range of biological activities, such as cytokine, cell proliferation, cell differentiation, immune modulation, haematopoiesis regulation, cell differentiation, immune modulation, haematopoiesis regulation, cell such growth, angiogenesis, activity in activity, chemotactic/ cell differentiation, immune modulation, haematopoiesis regulation, cell distributed activity, thrombolytic activity, chemotactic/ cell differentiation, antiinflammatory activity, thrombolytic activity, chemotactic/ cell distributed activity, and may also be involved in the determination of of bodily characteristics, fertility and behaviour. ORFX proteins, cell disorders such as psoriasis and benign tumours, cell disorders such as epilepsy and Alzheimer's disease, cell disorders such as psoriasis and benign tumours, cell disorders such as epilepsy and Alzheimer's disease, cell disorders of tissue growth and regeneration, cell diseases, and infectious diseases caused by viral, bacterial, cell diseases, and infectious diseases caused by viral, bacterial, cell diseases, in genetic diagnosis, and in forensic biology. The ORFX genomic sequences or transcripts, in the identification and cloning of homologous sequences, in genetic diagnosis, and in forensic biology. The ORFX protein, and in drug screening. The ORFX proteins may also be used as a multiple of the function and/or activity of ORFX cell diagnosis, and in the forential diseases. designated ORF (open reading frame) 1-4534, and sequences ABN75054-BBN75987 represent cDNAs encoding them. The invention also encompasses polypeptides at least 80% identical to the ORF1-ORF4534 (collectively referred to as ORFX) proteins, polynucleotides at least 85% identical to the orf nucleic acid sequences, vectors and host cells comprising ORFX polynucleotides, interecombinant production of ORFX proteins, antibodies specific for ORFX proteins, methods of detecting ORFX polynucleotides and Sequence Sequences ABP31028-ABP35561 represent 4534 novel human proteins treatment and monitoring of ORFX-associated diseases 104 AA;

apoptosis. Frogrammen very algorithms, leukaemia, lympnoma, treating or preventing cancer e.g. adenocarcinoma, leukaemia, lympnoma, melanoma, myeloma. Inhibition of the activity of the sequences of the invention are useful for treating disorders associated with increase in cell death or apoptosis such as acquired immunodeficiency syndrome (AIDS), neurodegenerative diseases (e.g., Alzheimer's disease, retinitis
                                                     pigmentosa, Parkinson's disease and cerebellar degeneration), ischae injuries (e.g., myocardial infarction, stroke, reperfusion injury), myelodysplastic syndromes (e.g., aplastic anaemia), toxin-induced diseases and other infectious or genetic immunodeficiencies. Sequence for the invention are used as vaccines and in gene therapy. The press sequence is fish E93 programmed cell death modulating protein conses
                                                                                                                                                                                                                                                                                    The present invention relates to novel programmed cell death modulating proteins and polynucleotides encoding such proteins. Sequences of the invention are useful to screen potential cellular apoptosis inhibiting compounds to determine their use as therapeutic agents for treatment of diseases associated with increased programmed cell death. They are also useful for treating or preventing disorders associated with decrease in apoptosis. Programmed cell death modulating sequences are useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 myeloma; nootropic; vasotropic; cardiant; E93 protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    proteins and polynuclectides encoding such proteins. Sequences of the C invention are useful to screen potential cellular apoptosis inhibiting CC compounds to determine their use as therapeutic agents for treatment of CC diseases associated with increased programmed cell death. They are also CC useful for treating or preventing disorders associated with decrease in CC apoptosis. Programmed cell death modulating sequences are useful for CC treating or preventing cancer e.g. adenocarcinoma, leukaemia, lymphoma, CC melanoma, myeloma. Inhibition of the activity of the sequences of the cinvention are useful for treating disorders associated with increase in cell death or apoptosis such as acquired immunodeficiency syndrome (C (AIDS), neurodegenerative diseases (e.g., Alzheimer's disease, retinitis CC pigmentosa, Parkinson's diseases (e.g., Alzheimer's disease, retinitis (C injuries (e.g., myocardial infarction, stroke, reperfusion injury), competication syndromes (e.g., aplastic anamenia), ischaemic CC diseases and other infectious or genetic immunodeficiencies. Sequences of the invention are used as vaccines and in gene therapy. The present content of the sequences of the invention are used as vaccines and in gene therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        useful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invent of discloses genomic DNA sequences (ABLIG176-ABL30511), expressed DNA sequences (ABLG1840-ABL16175) and the encoded proteins

(ABB57737-ABB72072).
The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of
                                                                                                                                                                                                             New isolated nucleic acid genes from Drosophila and

                       The present sequence is tomato beta galactosidase-1 (TBG-1) encoded by a cDNA derived from breaker, turning and pink fruit pericarp from 'Rutgers' tomato plants. This hydrolyses terminal non-reducing beta-D-galactosyl residues from beta-D-galactosides leading to loss of tissue integrity and fruit softening. This is used for modifying cell wall mecabolism and controlling ripening of fruit by altering activity of beta galactosidase I protein. Pectin with reduced galactosyl content is produced for use in biofilms or solutions. Transgenic plants with altered fruit ripening are produced by introducing DNA constructs comprising TBG cDNA. TBG forms a component of an enzyme mixture used to isolate protoplasts.
                                                                                                                                                                                                                                                        N-PSDB; AAZ29338.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072).
